

How to configure domain on Cloudflare

Make sure to have purchased a domain with your registrar.

1. A Record

When on Cloudflare, on the left you got a sidebar, click on DNS and then go to "Records"

Then create your A record

In the "**type**" box select "**A**"

In the "**Name**" slot you can put numbers, letters or "@"

You may be wondering what is the name slot, we can say it's your domain prefix.

Example: I own Example.net, if I set "name" to **play** I have to put play.example.net to join my minecraft server

Else, if I put @ in there, I can join with example.net

In "IPv4" slot you will put your server's numerical ip

You may be wondering "how do I find it, it's showing a subdomain" to which I will answer with:
there is [this tutorial](#)

play.alien-host.net points to 127.0.0.1.

| | | | | |
|-------------------------------|-----------------|-------------------------|--|------|
| Type | Name (required) | IPv4 address (required) | Proxy status | TTL |
| A | play | 127.0.0.1 | <input checked="" type="checkbox"/> DNS only | Auto |
| <small>Use @ for root</small> | | | | |

2. SRV Record

You may want to set this up if your port is **not** [25565](#)

Create a second record

Make sure the "Type" is SRV and not A

In the "name" slot you use the following line: **_minecraft._tcp.**

followed by your subdomain or domain if you are going to use one (in the picture below, the subdomain is **myserver**)

"**TTL**" should be "**Auto**"

"**Priority**" should be a low number e.g. 0 or 1

"**Weight**" should be below 5

"**Port**" is your server port, which can be found [in the console](#)

"**Target**" has to be set to your domain/alias shown in the panel (view picture below for an example)

_minecraft._tcp.myserver.alien-host.net points to astronova.alienhost.me and listens on 25777.

| | | | | | |
|------|---|--------------------------|--------------------------|------|--------------------------|
| Type | Name (required) | Priority (required) | Weight (required) | TTL | Port (required) |
| SRV | _minecraft._tcp.myserver | 1 | 1 | Auto | 25777 |
| | <small>E.g. _sip._tcp.example.com</small> | <small>0 - 65535</small> | <small>0 - 65535</small> | | <small>0 - 65535</small> |

Target (required)

astronova.alienhost.me

E.g. www.example.com
