How to configure domain on Cloudflare

> **Make sure to have purchased a domain with your registrar.**

1. A Record

When on Cloudflare, on the left you got a sidebar, click on DNS and then go to "Records"

Then create your A record

In the "**type**" box select "**A**"

In the "**Name**" slot you can put numbers, letters or "**@**"

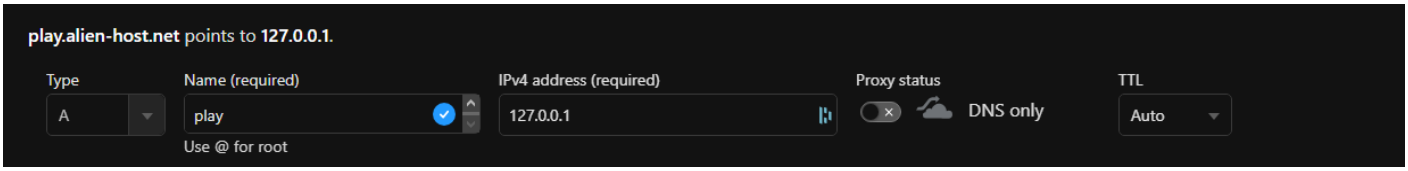

You may be wondering what is the name slot, we can say it's your domain prefix.

Example: I own Example.net, if I set "name" to **play** I have to put play.example.net to join my minecraft server

Else, if I put @ in there, I can join with example.net

In "**IPv4**" slot you will put your server's numerical ip

You may be wondering "how do I find it, it's showing a subdomain" to which I will answer with: there is this tutorial

2. SRV Record

> You may want to set this up if your port is **not** 25565

Create a second record

Make sure the "Type" is SRV and not A

In the "name" slot you use the following line: **_minecraft._tcp.**

followed by your subdomain or domain if you are going to use one (in the picture below, the subdomain is **myserver**)

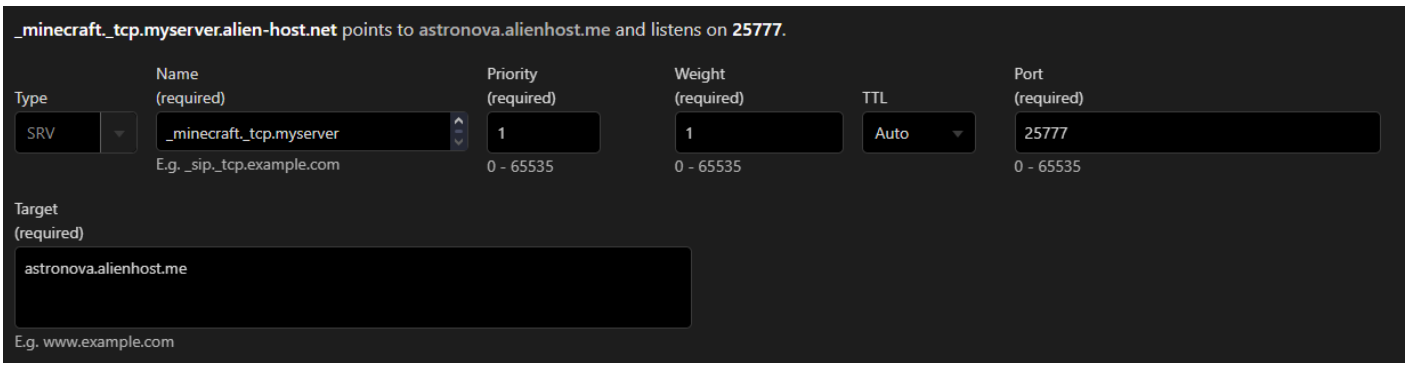

"**TTL**" should be "**Auto**"

"**Priority**" should be a low number e.g. 0 or 1

"**Weight**" should be below 5

"**Port**" is your server port, which can be found in the console

"Target" has to be set to your domain/alias shown in the panel (view picture below for an example)
