

# Velocity

You'll need extra ports for this tutorial. 1 for each server with voicechat plugin.

## 1. Every server on the same node

### On The Backends:

Download [SimpleVoiceChat Bukkit](#)

Go to the "plugins" folder and upload it.

Restart the server.

Inside the "plugins" folder, you will find a "voicechat" folder. Click on it.

Open the "voicechat.properties" file.

On line 5 you'll find the port variable. Set it to the additional port's value

### On The Proxy:

Install [SimpleVoiceChat for Velocity](#)

The plugin will automatically detect the port of each voice chat server and will forward everything to the correct destination.

## 2. Servers on different nodes

Follow the steps for "Every server on the same node" and:

set **voice\_host** on the backend servers to their (the backend's) actual IPv4
