

Where do I get the velocity.yml?

Your velocity.yml server may look like this

A screenshot of a File Manager interface with a dark background and a starry space theme. The title bar says "File Manager". Below it, the path "/ home / container / velocity.toml" is shown. The main area displays the content of the file with line numbers 1 through 10 on the left. The code is as follows:

```
1 #If you are using modern or BungeeGuard IP forwarding, configure a file that contains a unique secret here.
2 #The file is expected to be UTF-8 encoded and not empty.
3 forwarding-secret-file = "forwarding.secret"
4 config-version = "2.7"
5 #Should the proxy enforce the new public key security standard? By default, this is on.
6 force-key-authentication = true
7 # What should be the MOTD? This gets displayed when the player adds your server to
8 # their server list. Only MiniMessage format is accepted.
9 motd = "\\<#09add3>A Velocity Server"
10
```

To obtain the entire file, head to [this page](#). Now copy and paste the content into your velocity.yml.
